| Molec
hytoene synthase (EC 2.5.1.-) - tomato
;Alternate names: ripening protein 5
;Species: Lycopersicon esculentum (tomato)
;Species: Lycopersicon esculentum (tomato)
;Date: 19-Mar-1997 #sequence revision 18-Jul-1997 #text change 02-Mar-2001
;Accession: 522474; S06221; S35155; S35154; S21981; S24367; S24968

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 6, p

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 8, Application US/08096623A
Patent No. 568428
GENERAL INFORMATION:
APPLICANT: Ausich, Rodney L.
APPLICANT: Brinkhaus, Priedhelm L.
APPLICANT: Brinkhaus, Priedhelm L.
APPLICANT: Wukharji, Indrani
APPLICANT: Wen, Huei-Che B.
TITHE OF INVENTION: Biosynthesis of Zeaxanthin and
TITHE OF INVENTION: Glycosylated Zeaxanthin in Genetically Engineered Hosts
NUMBER OF SEQUENCES: 104
CORRESPONDENCE ADDRESS:

```

The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopentenyl pyrophosphate and a nucleic acid molecule contoding an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon substrate to produce a carotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and astaxanthin, by

N

```
using microorganism having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolise single carbon substrates. The carotenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The carotenoids are also useful as intermediates in the synthesis of steroids flavours and fragrances and compounds for potential electro-optic applications. The present sequence is Methylomonas 16a sp. diapophycome dehydrogenase (CrkR) enzyme used in the invention. (Updated on 07-AUG-2003 to correct OS field.)

```
The invention relates to a high growth methanotrophic bacterial strain, which grows on a CI carbon substrate e.g. methane and methanol, and comprises a functional Embden-Meyerhof carbon flux pathway comprising a comprises a functional Embden-Meyerhof carbon flux pathway comprising a gene coding a pyrophosphate dependent phosphofrutokinase enzyme or a 16s CRNA. The bacterial strain is useful for the production of single cell protein and for the biotransformation of a nitrogen-containing compound, e.g. ammonia, nitrate, nitrite or nitrogen. It is also useful for the production of a feed product comprising a protein, carbohydrates and a pigment and for reducing oxygen demand, for removing nitrates and contrintes in methane-containing environments such as landfills, waste water treatment systems or anywhere that methane, oxygen and nitrates are contribly agent for the conversion of nitrate or nitrite to nitrous coile with methane or methanol as a carbon source. It is also used in the cord with methane or methanol as a carbon source. It is also used in the cord writing animal feeds), in production of terpenoid and carotenoid of generating animal feeds), in production of terpenoid and carotenoid compounds, useful as pigments and as monomers in polymeric materials and cin production of expolysaccharides at high levels. Sequences ABG61551-CR ABG61590 represent high growth methanotrophic bacterial strain proteins of the invention.
                                                                                                                                                                                                                                                                                                                        New high growth methanotrophic bacterial strain, useful for producing single cell proteins, grows on a Cl carbon substrate, and comprises a functional gene encoding in Embden-Meyerhof carbon pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 11; Page 153-154; 157pp; English.

The invention is useful for obtaining a nucleic acid molecule encoding an isoprenoid compound biosynthetic enzyme, and for the microbial production of isoprenoid compounds. The molecules of the invention are also useful for requlating isoprenoid biosynthesis in an organism and for production recombinant organisms for producing various isoprenoid compounds. The nucleic acid is also useful for feed additive, for the production of keratenoids and their derivatives, isoprenoid intermediates, and as pure products useful as pigments, flavours and fragrances. The present amino acid sequence represents the Methylomonas 16a open reading frame 9 (ORPS) cerro? ((crth copyz) copy 2 of diapophytoene dehydrogenase enzyme) protein of the invention, as described above

```
The present invention describes nucleic acid sequences encoding carotenoid biosynthetic enzymes (CBES). Also described: (1) a CBE polypeptides; (2) a chimeric gene (CG) containing a CBE linked to regularory sequences; (3) host cell transformed with CG; (4) obtaining a nucleic acid that encodes a CBE; (5) products of method (4); (6) producing an omega-aldehyde-functionalised carotenoid (X); (7) producing an omega-carboxy-functionalised carotenoid (Y); (8) producing an omega-carboxy-functionalised carotenoid (Y); (8) producing Carotenoids (2); and (9) regulating carotenoid (Y); (8) producing Carotenoids (BES can be used for microbial production of aldehyde-or carboxy-functionalised carotenoids and are potentially useful as pigments and and C30 carotenoids, and are potentially useful as pigments and cartox carboxy-functionalised carotenoids antioxidants, e.g. as feed additives. The present sequence represents a used in the exemplification of the present invention.

The present invention describes mucleic acid sequences encoding carotenoid biosynthetic enzymes (CBES). Also described: [1] a CBE polypeptides; [2] a chimeric gene (CG) containing a CBE linked to polypeptides; [3] host cell transformed with CG; [4] obtaining a cequiatory sequences; [3] host cell transformed with CG; [4] obtaining a mucleic acid that encodes a CBE; [5] products of method (A); [6] producing an omega-aldehyde-functionalised carotenoid (X); [7] producing carotenoids (Z); and (9) regulating carotenoid (Y); [8] producing CG carotenoids (Z); and (9) regulating carotenoid biosynthesis in an organism. CBE sequences have antioxidant activity. CBEs can be used for microbial production of aldehyde- or carboxy-functionalised carotenoids and CGO carotenoids, and are potentially useful as pigments and crivity cas sefect additives. The present sequence represents a CTLNZ CBE protein isolated from Staphylococcus aureus, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SHIVIGGGLGGISAAIRWAQSGYSVSLYEQNNHIGGKVNRHESDGFGFDLGPSILTMPY

A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an antibody to the protein, is nucleic acid encoding the protein, or an antibody to the protein, is useful as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepsis in a patient. The composition can also be used for diagnostics. The protein is also used in an assay for enzymatic studies and as a target for antibiotics. This sequence represents one of the novel S. aureus proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       126
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PLDIQAKYYSNQGSIYGVVADRFKOLGFKAPQRSSELSNLYFVGGSVNPGGGMPMVTLSG 485

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         essential gene; cell proliferation; drug design

proliteration, 17) reductiving a compound using a biological pathway required for proliferation, or that inhibits callular proliferation. (8) identifying a gene required for callular proliferation or the biological pathway in which a proliferation required for callular proliferation or the biological pathway in which a proliferation required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound's activity, (11) a culture comprising strains in which the gene or product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains, or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for cellular proliferation to isolate candidate molecules for rational dascovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryoric essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of ftp.wipo.int/pub/published_pct_sequences

Sequence 497 AA;

or screening

New antisense nucleic acids, useful for identifying proteins or scre for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

The invention relates to an isolated nucleic acid comprising any one of the invention relates to an isolated nucleic acid comprising any one of the soll antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid.

(2) a lost cell containing the the nucleic acid antisense nucleic acid, (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid, (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation, (8) identifying a gene preduct for cellular proliferation or the biological pathway in which a proliferation required gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) namifacturing an antiploid; (10) profiling a much contains an activity of the proliferation of an organism acts; (9) namifacturing an antiploid; (10) profiling a much contains an acts of the proliferation of an organism acts; (9) namifacturing an antiploid; (10) profiling a much contains and acts of the proliferation of an organism acts; (9) namifacturing an antiploid; (10) profiling a much contains and acts of the proliferation of an organism acts and acts of the proliferation of an organism acts and acts of the proliferation of an organism acts are accompanied to the proliferation of an organism acts and acts of the proliferation of an organism acts and acts of the proliferation of an organism acts and acts of the proliferation of an organism acts and acts of the proliferation of an organism acts and acts of the proliferation of an organism acts and acts of the proliferation of an organism acts and acts of the proliferation of an or compound's activity; (11) activities comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate micleules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at Claim 25; SEQ ID NO 71801; 1766pp; English. ftp.wipo.int/pub/published_pct_sequences n electronic

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus facealis. The invention is a also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify antibodies capable of binding to the express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The proteins can be used to screen compounds in rational drug discovery programmes. The used to screen compounds in rational drug discovery programmes. The proteins can be used to screen compounds in rational proliferation in a wide variety of organisms. The present sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from Wide at the propertices.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       126
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                63 IFEKLFEYSKKÇMSDYVTIKRLPHQWRSFFPDGTTIDLYEGIKSTDQHNAILSNKDIEEL 122

                                                                                                                                                                                                                                                                                                                                                  The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the geneme of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polymorphisms encoded by the genes are used for detection/identification of polymorphisms; for gene analysis and for a detection/identification. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that modulate, requires, induce or inhibit expression of the genes in plants, animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. cembraction of the proteins, particularly toxins and antibacterials useful as insectioides, bactericides and fungicides. The genes, proteins, vectors containing the genes and Ab are also useful therapeutically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens containing the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           68 FEALFTGAGKNMADYVQIQKVEPHWRNPPEDGSVIDLCEDAETQRRELDKLGPGTYAQFQ 127

There are a total of six relevant genes in a 7900 bp region that cause B. coli cells to produce GGPP and the carotenoids phytoene through caxoanthin digliucoside, which is the final prod. identified in the carotenoid pathway contd. in plasmid paRG376 (contg. a ca. 13 kb chromosomal DNA fragenet isolated by Perry et al., J. Bacteriol., 168:607 (1986). The genes for geranylgeranyl pyrophosphate (GGPP) synthase, phytoene synthase, phytoene deranylgeranyl pyrophosphate (GGPP) synthase, phytoene devanthin glycosylase are represented in AAQ13716, AAQ13718, AAQ13719, AAQ13722, AAQ13724 and AAQ13726 are respectively. Recombinant expression plasmids can be used to produce large ants. of the enzymes and hence large ants. of the carotenoids which they synthesise. Carotenoids are pigments with a variety of applications.

There are a total of six relevant genes in a 7900 bp region that cause E. coli cells to produce GGPP and the carotenoids phytoene through zeaxanthin diglucoside, which is the final prod. identified in the carotenoid pathway confd. in plasmid pARG376 (cong. a ca. 13 Kb chromosomal DNA fragment isolated by Perry et al., J. Bacteriol., 168:607 (1986). The genes for geranylgeranyl pyrophosphate (GGPP) synthase, phytoene synthase, phytoene dehydrogenase-4H, lycopene cyclase, beta-carotene hydroxylase, and zeaxanthin glycosylase are represented in AAG13718, AAG13719, AAG13722, AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and AAG13724 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   67 IPEALFTGAGKNMADYVQIQKVBPHWRNPFEDGSVIDLCEDABTQRRELDKLGPGTYAQF 126

Increasing prodn. of total carotenoid(s) in a higher plant - by transforming with vector encoding chloroplast transit peptide operably linked to the Erwinia herbicola lycopene cyclase structural gene. GGPP synthase; lycopene cyclase; phytoene synthase; beta-carotene; phytoene dehydrogenase-4H; carotenoid; C40; zeaxanthin; diglucoside; pigment; food colourant; chloroplast transit peptide; increase yield; tobacco ribulose bis-phosphate carboxylase-oxygenase. Brinkhaus FL, Proffitt J, Mukharji I, Yarger J; Phytoene dehydrogenase-4H encoded on pARC146D. The present sequence is that of a recombinant Erwinia herbicola phytoene dehydrogenase-4H (from pARC146D) which produces lycopene biosynthetically from phytoene through four sequential dehydrogenations coher cardinal phytoene through four sequential dehydrogenations. Other caranylgeranyl pyrophosphate (AAW01119), phytoene synthase (W01121) and lycopene cyclase (AAW01125). Manipulation of, in partic., lycopene (AAW01125), by in frame linkage to the chloroplast transit peptide (AAW01124) of the tobacco ribulose bis-phosphate carboxylase-cyclase gene can lead to increased production of total carotenoids in the chloroplast of transformed plants as compared to native, nontransformed plants of the same type. Beta-carotene is an effective and apparently harmless food colourant and is also in the pathway for biological synthesis of further C40 carotenoids such as zeaxanthin and zeaxanthin diglucoside. (Updated on 25-MAR-2003 to correct PP field.)

Brwinia herbicola phytoene dehydrogenase-4H.

This sequence represents Erwinia herbicola phytoene dehydrogenase encoded by DNA from the plasmid pARC146D. Phytoene dehydrogenase is an enzyme which is involved in the biosynthesis of carotenoids, esp. lycopene, from the ubiquitous precursor, farmesyl pyrophosphate. In B. harbicola, phytoene has been found to be formed biosynthetically in a two-step process. The initial step is the condensation of farmesyl pyrophosphate (FPP) and isopentyl pyrophosphate of form GGPP. This reaction is catalysed by GGPP synthase. This first step is immediately followed by a tail to tail dimerisation of GGPP, catalysed by the enzyme phytoene synthase, to form phytoene dehydrogenase-4H. The genes encoding catalytic action of phytoene dehydrogenase-4H. The genes encoding a host call for the commercial production of lycopene which is used as a food colourant. Plants transformed with the phytoene dehydrogenase-4H coding sequence are protected from the herbicide norflurazon. (Updated on 25-WAR-2003 to correct PF field.) A novel DNA molecule has been isolated which encodes an Erwinia herbicola lycopene cyclase enzyme that converts lycopene to beta- carotene. The DNA molecule comprises at least 1125 bp and is present in the plasmids pARC1510; pARC1510 and pARC1520. The present sequence represents the amino acid sequence corresponding to the structural gene for phytoene fehygrogenase-4H. The new DNA molecule can be used to produce the recombinant enzyme and transgenic organisms, e.g. yeasts or plants, increased beta-carotene levels. Beta- carotene is used as a colourant in margarine and butter and as an intermediate for vitamin A, and may prevent cancer. (Updated on 25-MAR-2003 to correct PP field.)
